

Applied Machine Learning Final Project Presentation

Guidelines

During the last class, each group will present their project using PowerPoint slides. All group members must participate to receive individual credit. Since all groups must present during the 90-minute class period, keep presentations under 10 minutes, allowing time for questions and discussion.

Presentations should generally use the same outline as your project report:

- Title
- Introduction
- Data
- Methods
- Results
- Discussion
- Limitations
- Future Work

While your presentation outline is similar to your report outline, your presentation differs from your report in that you should leave out some detail (e.g., around data cleaning, data exploration, model tuning), in favor of providing a high-level understanding of your problem/question, your data, your methods, and your results.

It is recommended that teams practice the presentation using a group Zoom or Teams meeting. Make sure each group member knows how much time they have for their piece of the presentation and time your presentation during practice. Designate one team member to share the presentation on their screen when it comes time to present.

General Grading Rubric

- Live Presentation: Did all team members participate? Was the presentation delivered in the allotted time? Did the presentation look practiced?
- Quality/Effort/Following Instructions: Are the presentation materials well edited and free of typos? Was effort put into the presentation?
- Organization: Was the presentation well organized and did topics logically connect?
- Content: Did the presentation effectively communicate a high-level overview of the project and its results? Was it easy to understand high level goals including prediction and inference?
- Effective Use of Visualizations: Did the presentation make effective use of visualizations where appropriate?
